

CSCI 3130 – Software Engineering

Summer 2011

Project Milestone 3 – Project management plan and software requirements specification

Due May 26, 2011

For this milestone, you must conduct an analysis of the software requirements and create the software requirements specification plan. Include as an appendix at least one data flow diagram that you used while analyzing the requirements. Later in the semester we will discuss the use case methodology for specifying functional requirements, but bonus points are available for taking on the self-directed learning necessary to integrate use cases into the process at this point in time.

For the project management plan, you can either augment your charter document so that it includes all the necessary details or create a separate plan.

Links to templates for the two documents can be found on the course schedule (May 17). Feel free to use another template if you find one that you feel is better suited to the project. Links to a slide deck with further info about data flow diagrams and use cases is also provided.

Marking:

10% (+1%) total: 5% SRS (+1% for incorporating use case methodology), 5% PMP
