

Wason Selection Task

Each card has a letter on one side, and a number on the other.

Hypothesis: 'If a card has a vowel on one side, it has an even number on the other side'

Which card(s) should you select to test the hypothesis?

Wason Selection Task

Should turn over E and 7

- E could confirm the hypothesis
- 7 could disprove hypothesis
- the other cards have nothing to do with the hypothesis

P	Q	$P \rightarrow Q$	$\neg P \vee Q$
T	T	T	T
T	F	F	F
F	T	T	T
F	F	T	T

P = vowel	Q = even number
$\neg P$ = consonant	$\neg Q$ = odd number

Experimental Findings

- Results of 1970s study with 128 people:

{	5	(3.9%)	chose E and 7
	59	(46.1%)	chose E or 7
	42	(32.8%)	chose E alone
- people do better with concrete examples when the hypothesis is about related things
 - E.g. if the letter is sealed then it has a 43-cent stamp on it
 - Not: if I eat haddock then I drink gin
- examples and explanation from Eysenck and Keane [2]
