

# Introduction to Electroencephalography (EEG)

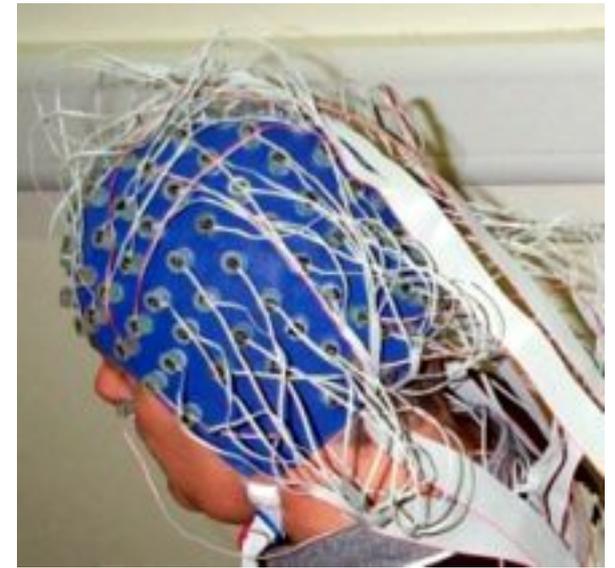

# Outline

- Introduction & History
- Neurophysiological Basis of EEG
- Recording Standards
- Applications
- Example ERP Study

# Introduction

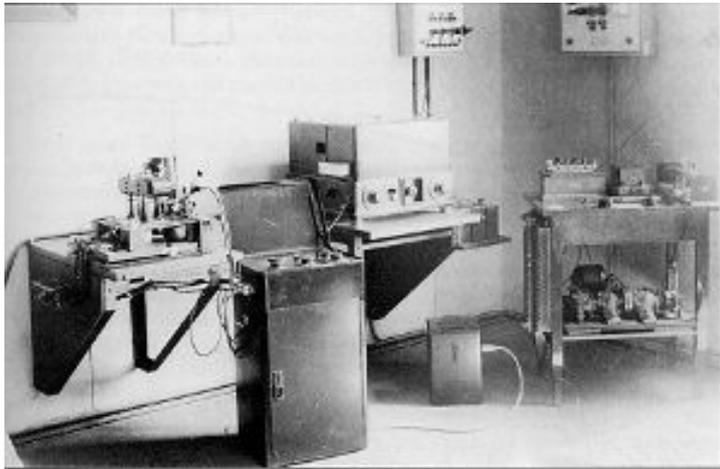

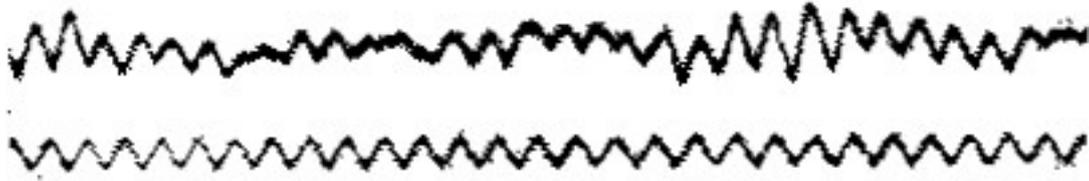

- EEG: electrical activity recorded via electrodes on the scalp
- High temporal resolution (millisecond scale) and low spatial resolution
- Relatively cheap neuroimaging technique

# Brief History

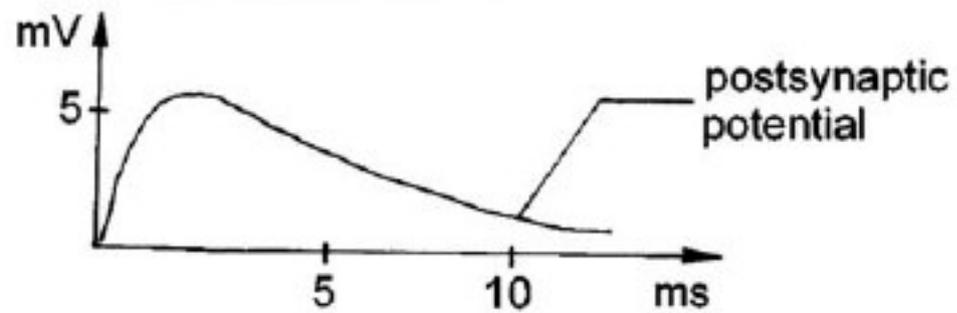

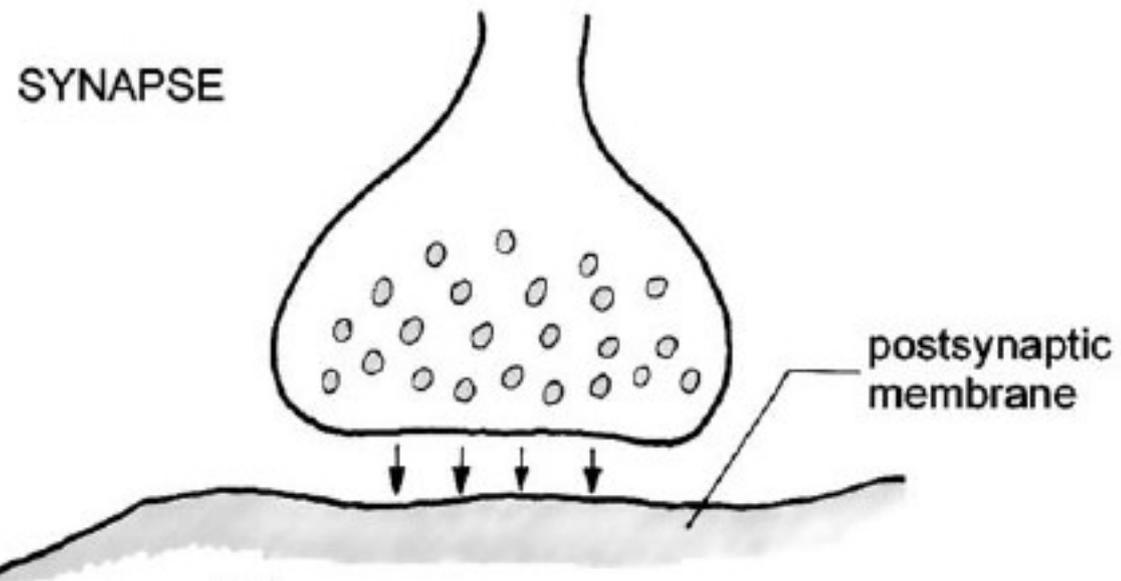

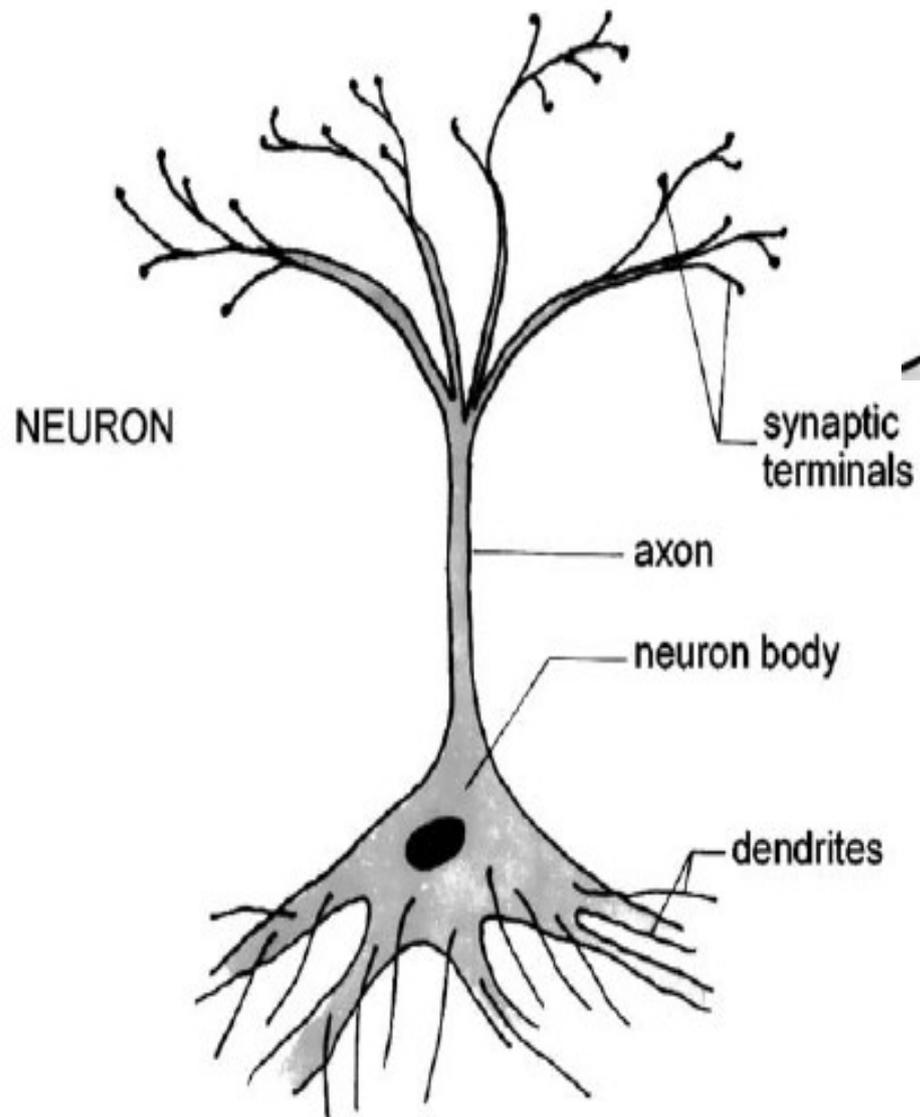

- Vladimirovich (1912)
  - first animal EEG study (dog)
- Cybulski (1914)
  - first EEG recordings of induced seizures
- Berger (1924)
  - first human EEG recordings
  - 'invented' the term electroencephalogram (EEG)
- American EEG Society formed in 1947
- Aserinsky & Kleitman (1953)
  - first EEG recordings of REM sleep

# Hans Berger (1924)

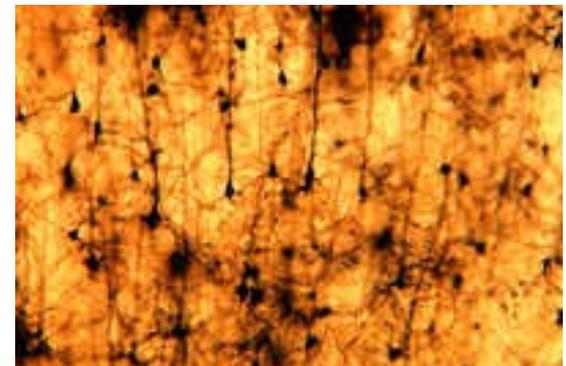

# Neurophysiological Basis of EEG

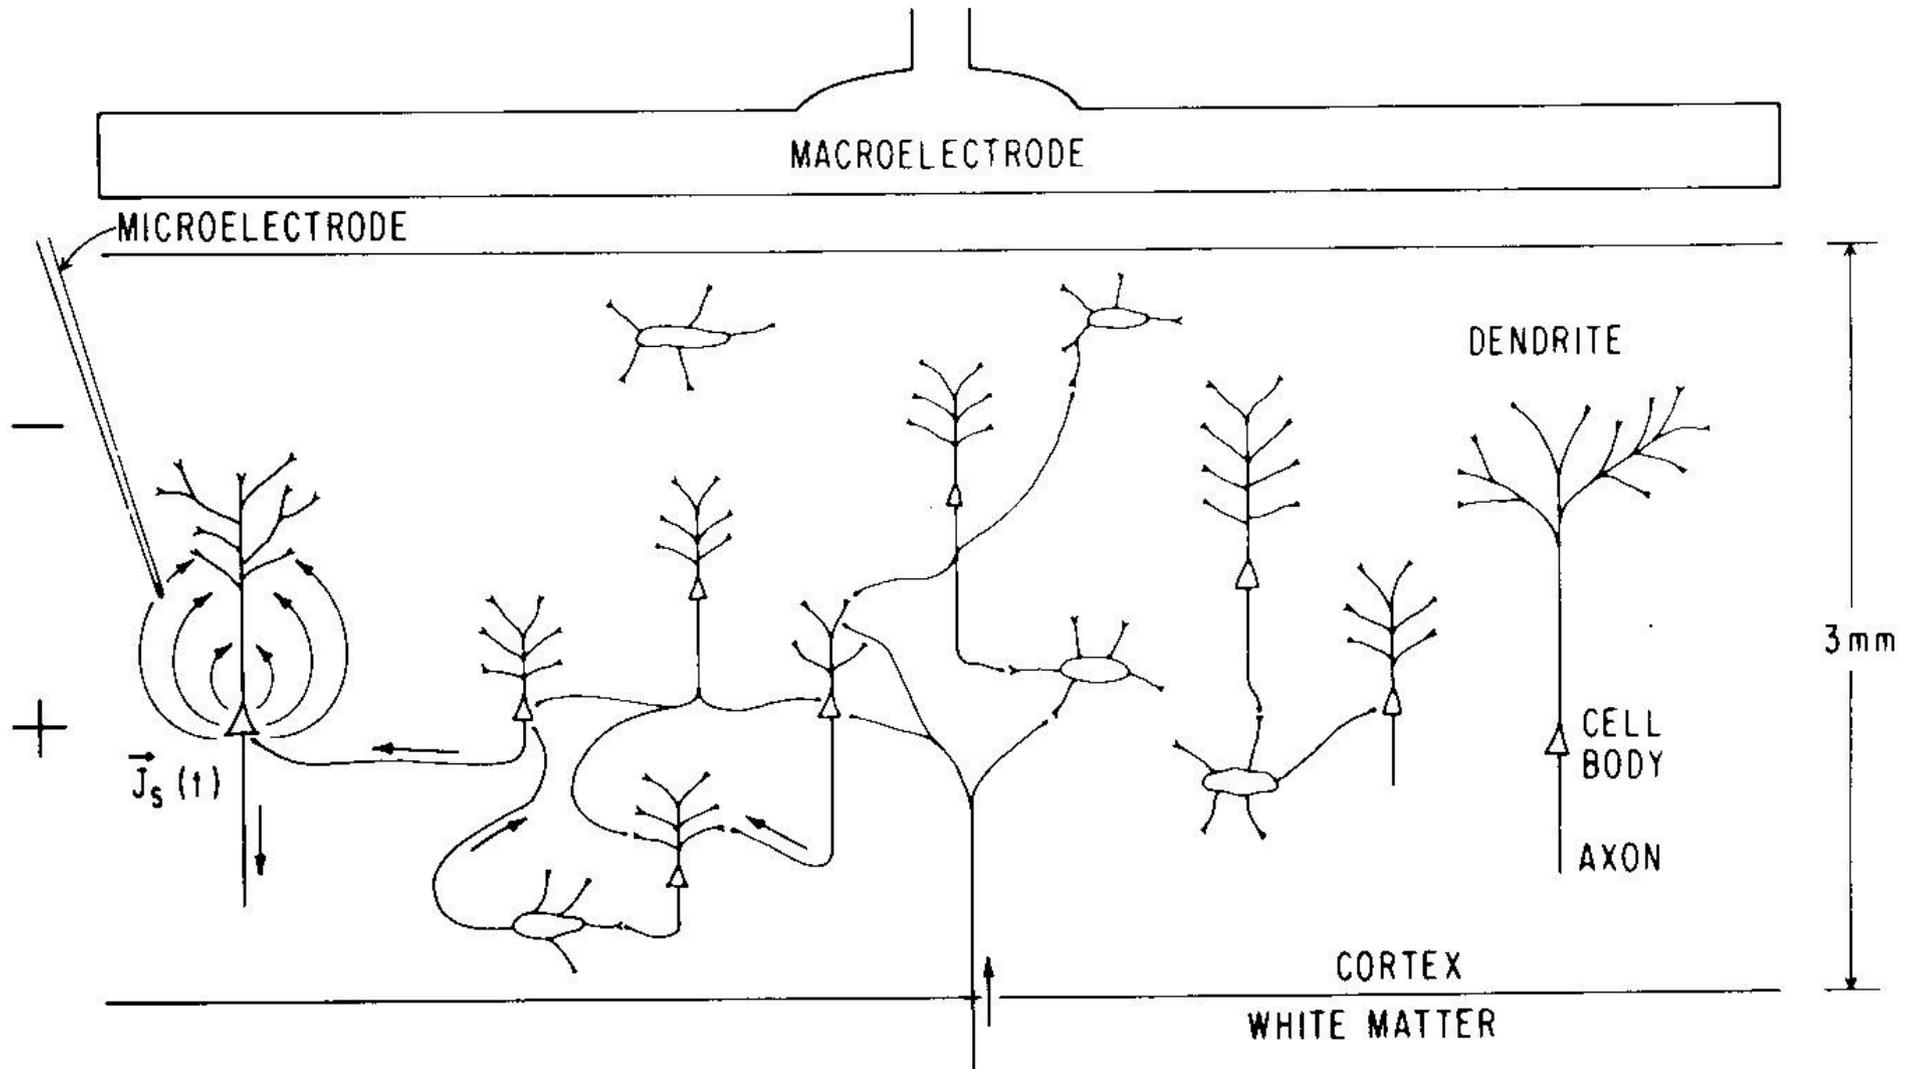

# Neurophysiological Basis of EEG

- Single neuron activity is too small to be picked up by EEG
- EEG reflects the summation of the synchronous activity of many neurons with similar spatial orientations
- Cortical pyramidal neurons produce most of the EEG signal
- Deep sources (subcortical areas) are much more difficult to detect than currents near the skull

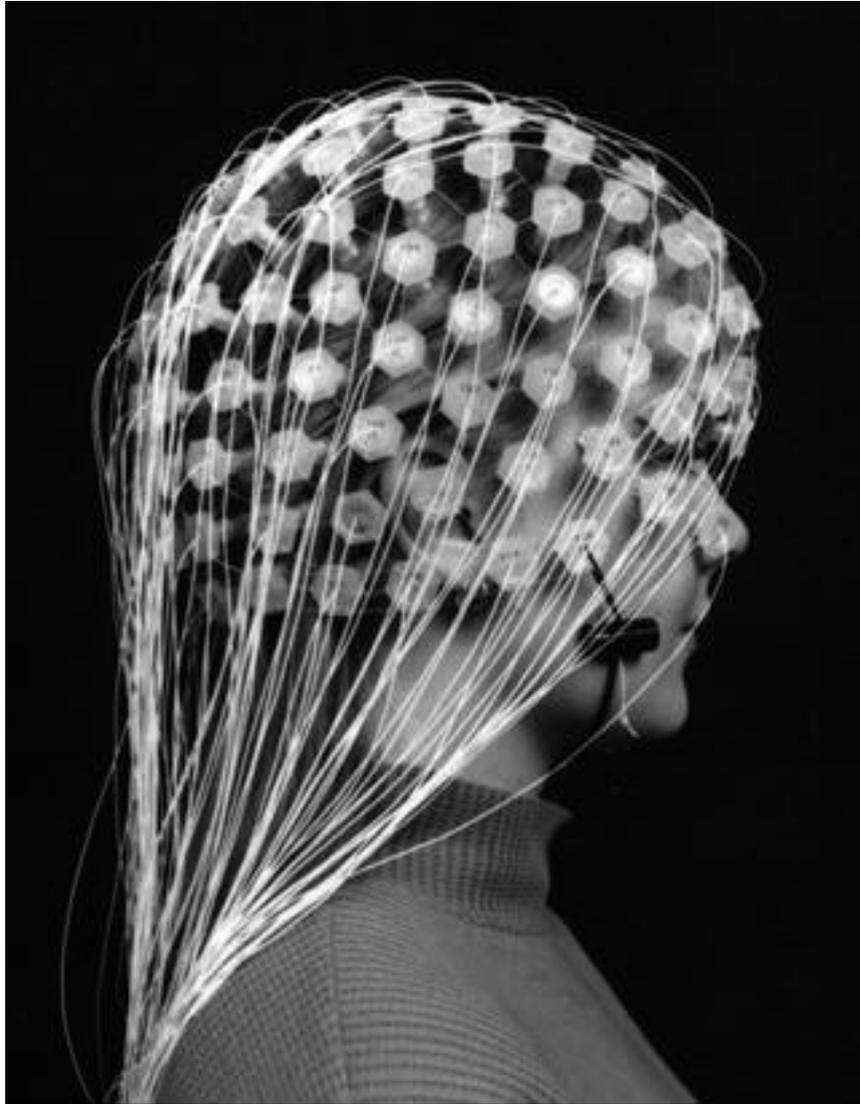

# Scalp EEG Recordings

# Recording Standards

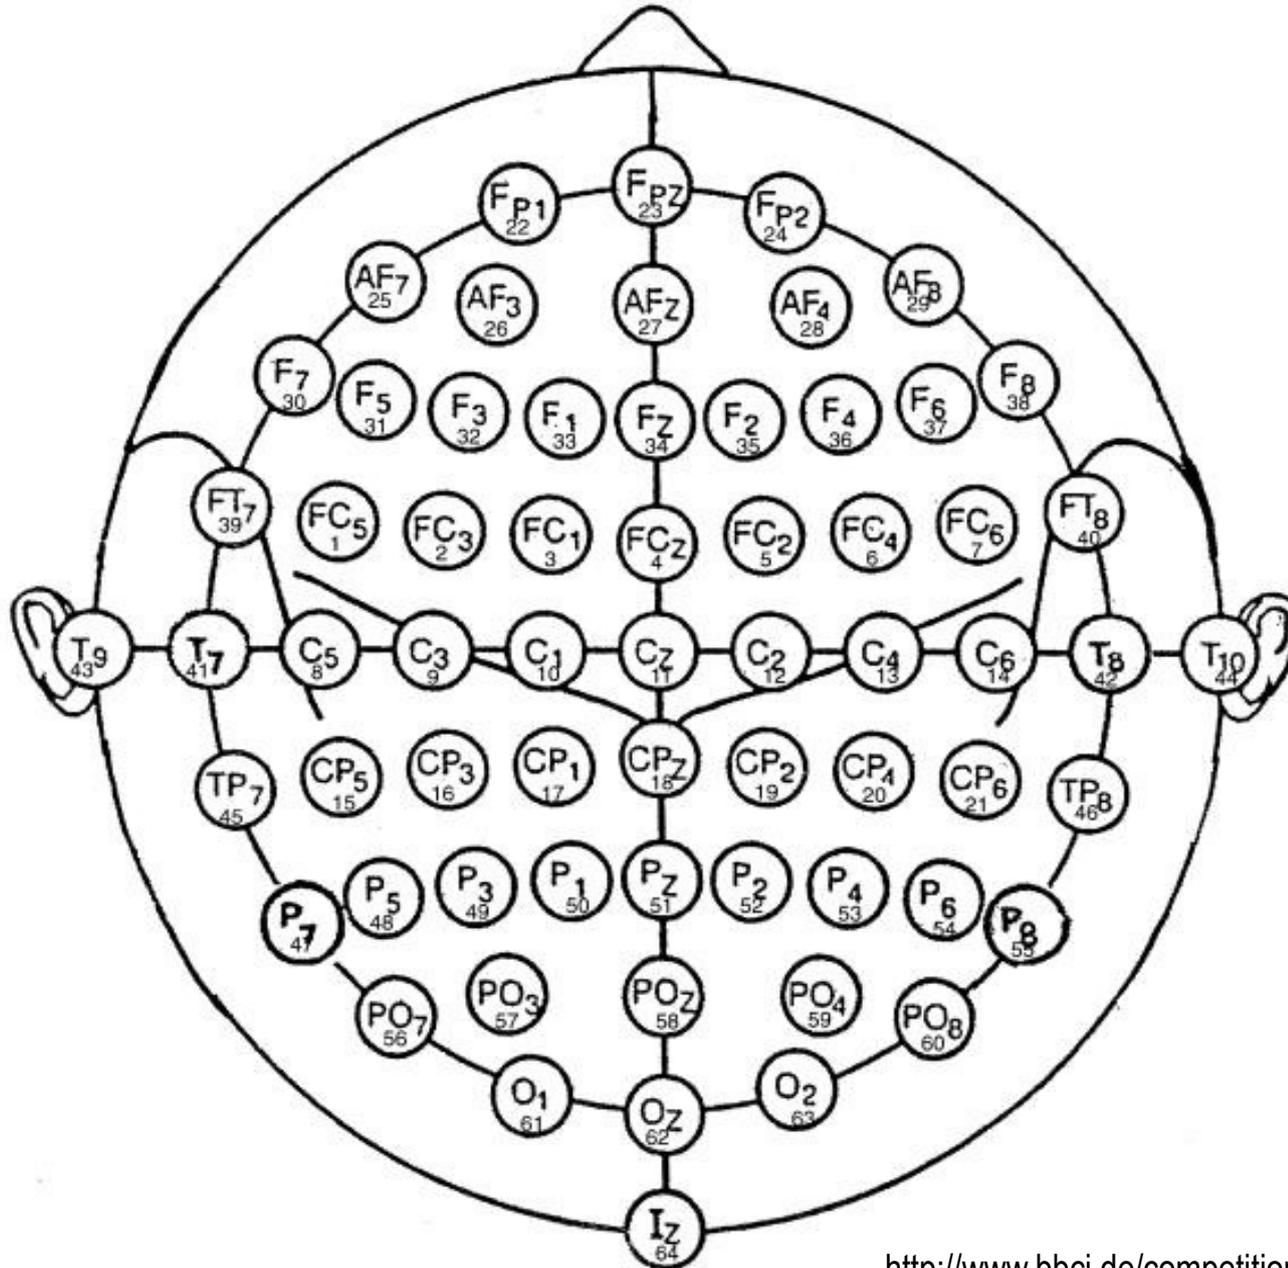

# EEG Systems

# Electrode Placement

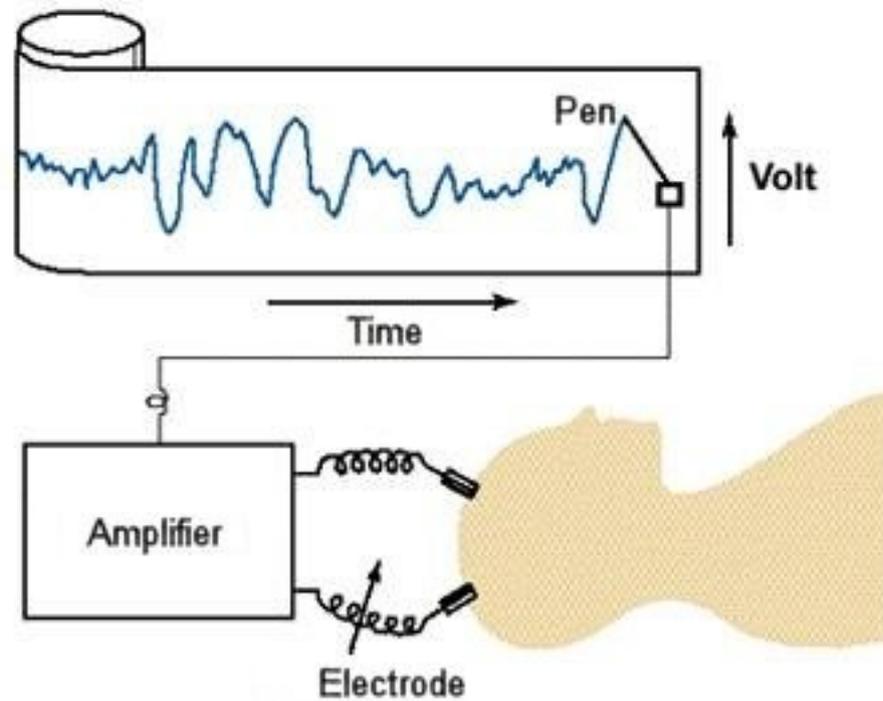

# Electrode Placement

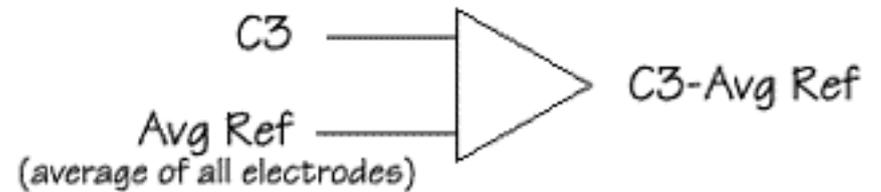

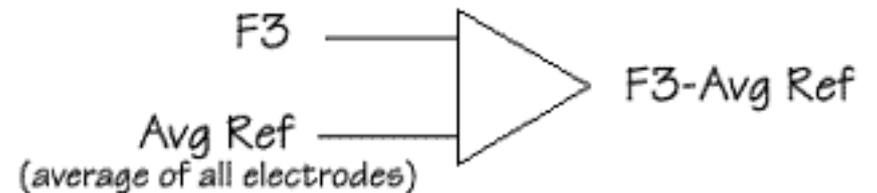

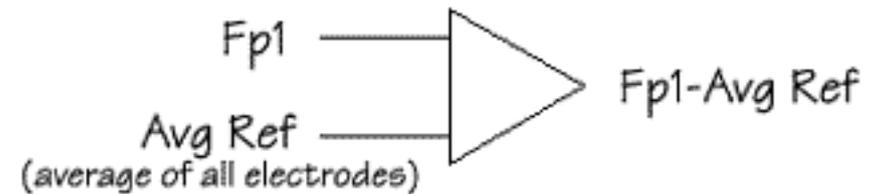

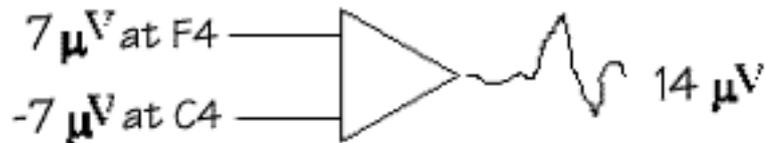

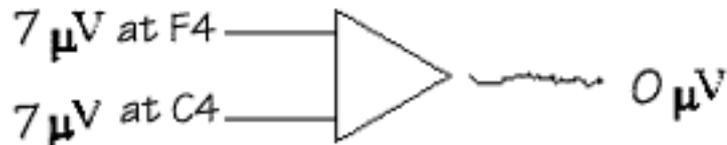

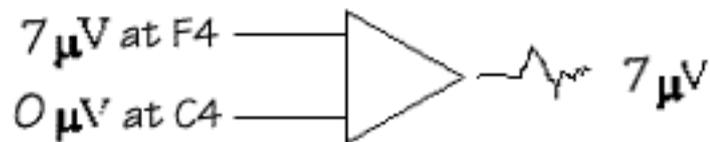

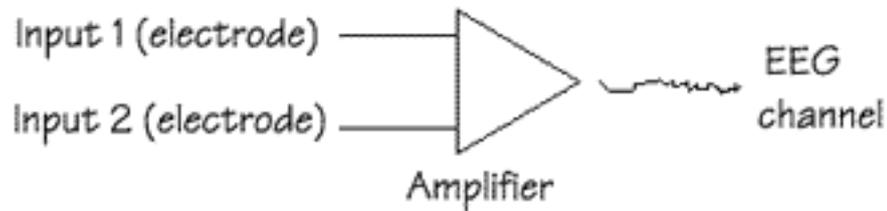

**Figure 3.** Electrodes placement in 10-20 system.

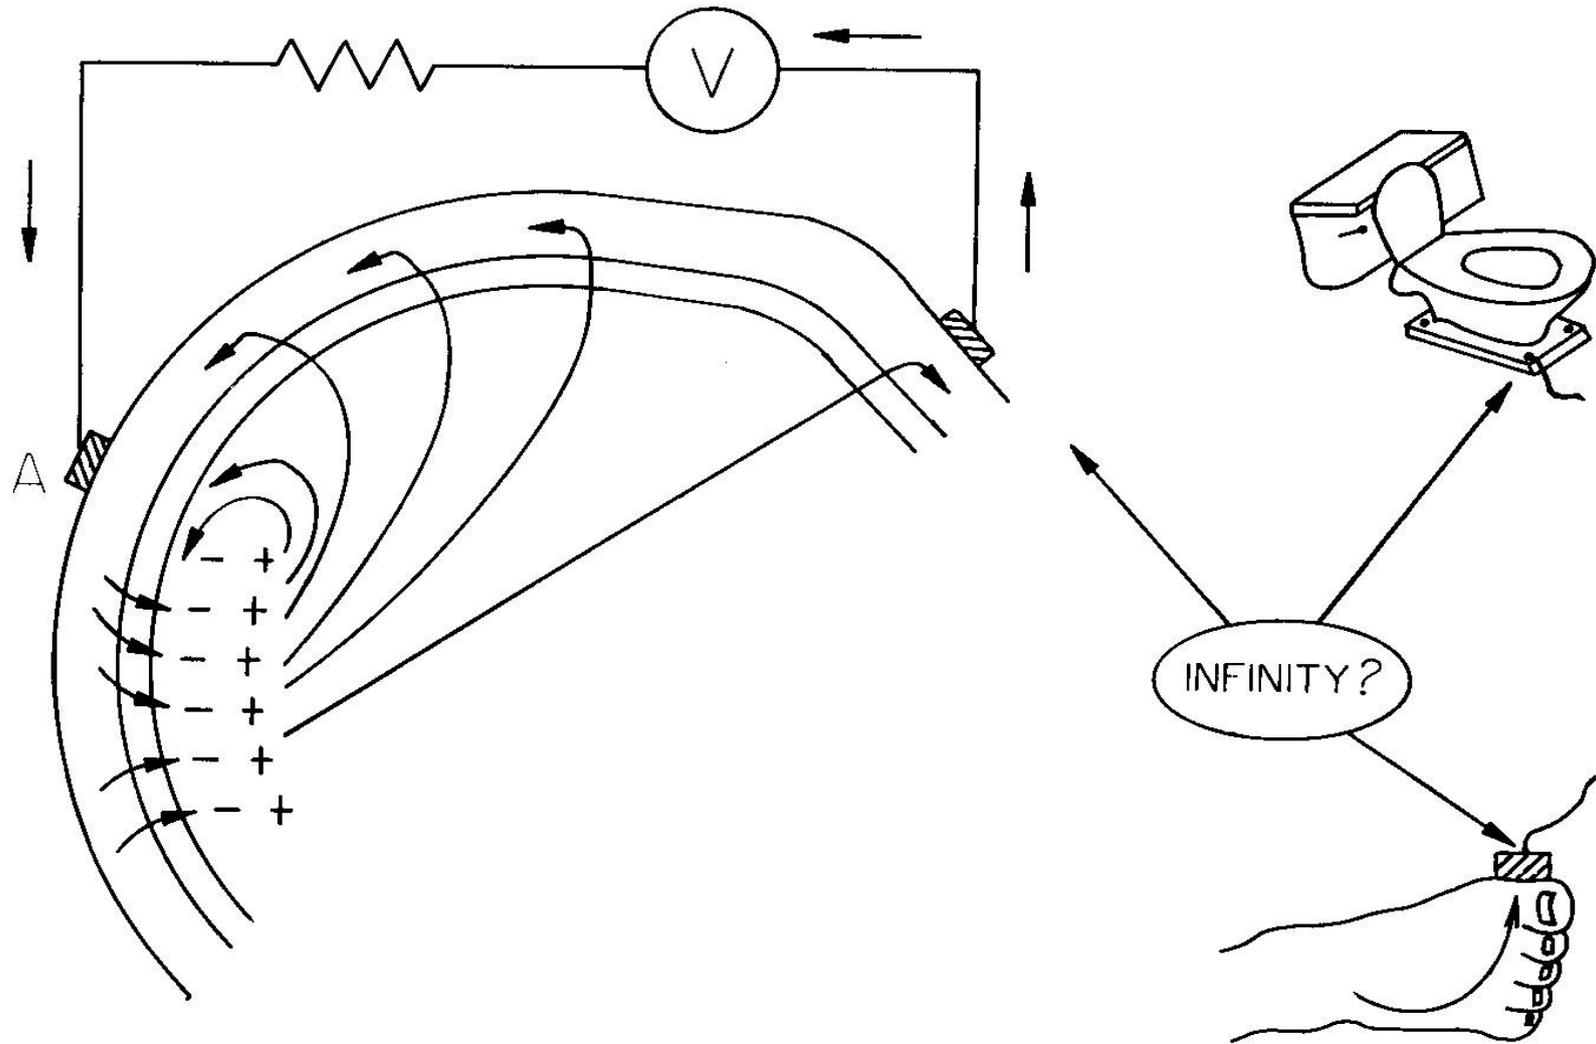

# Recording EEG Signals

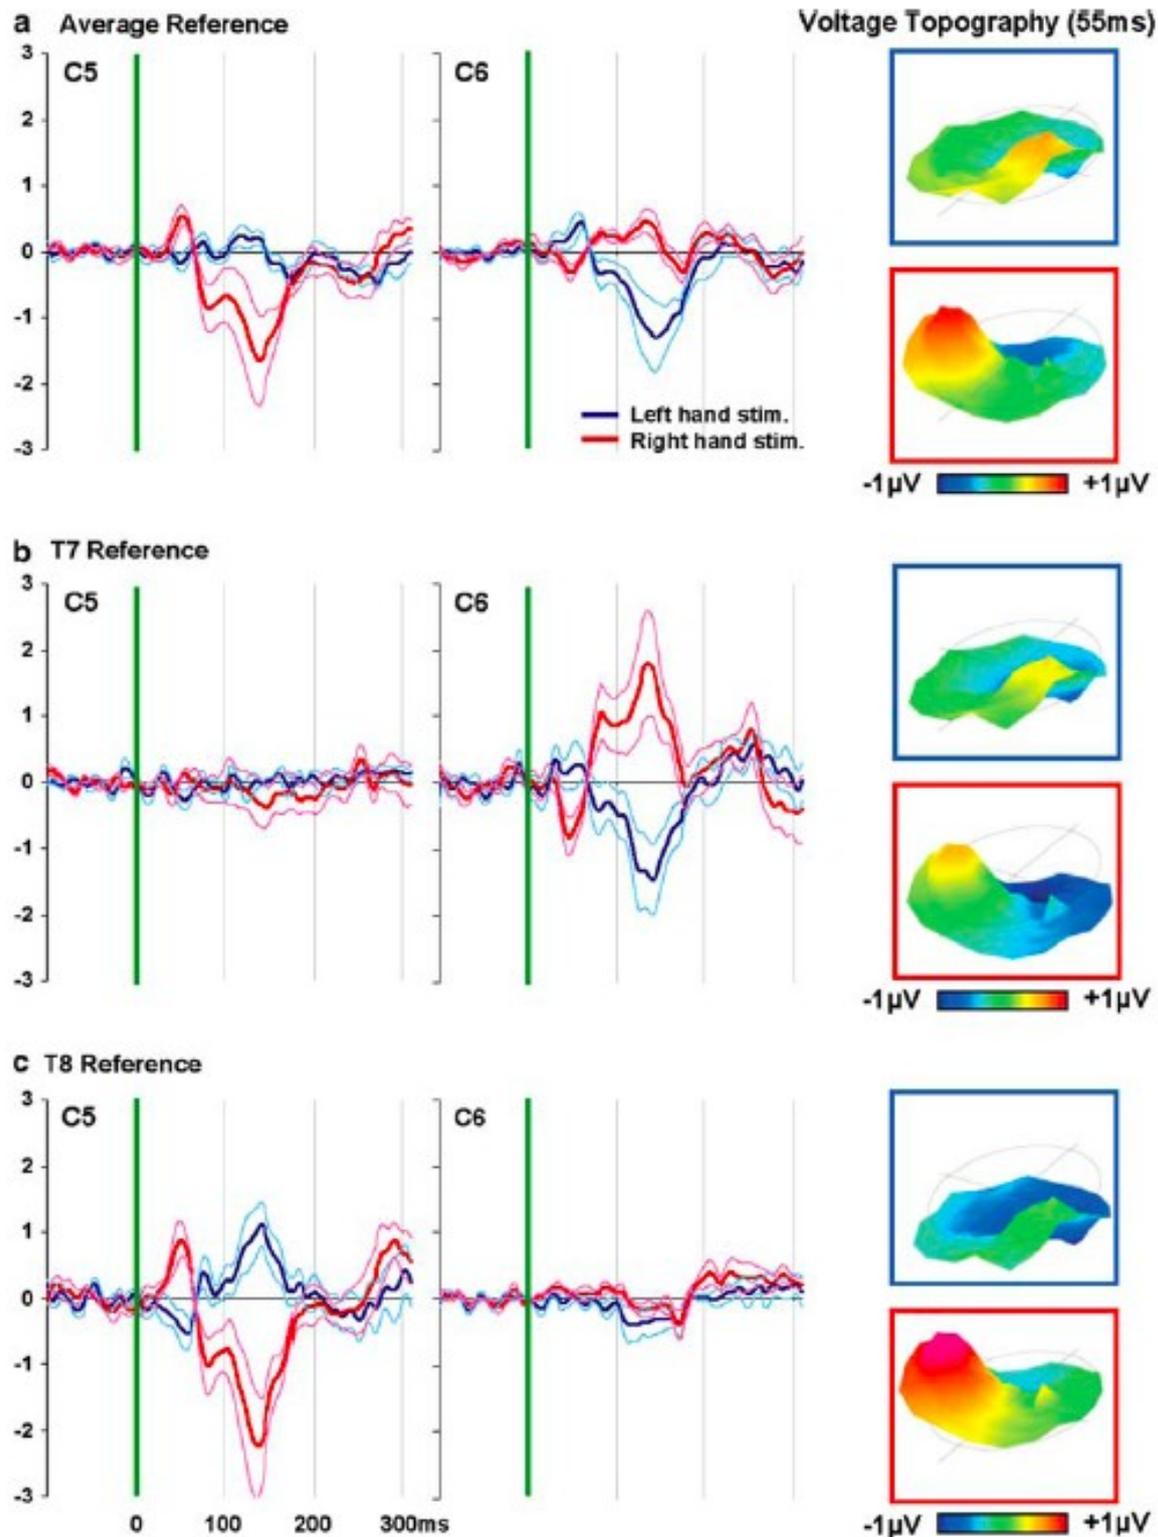

# Referencing

# Perfect Reference?

# Effect of the Reference Electrode

(Murray et al., 2008)

# Applications

# EEG Rhythms

**Aroused**

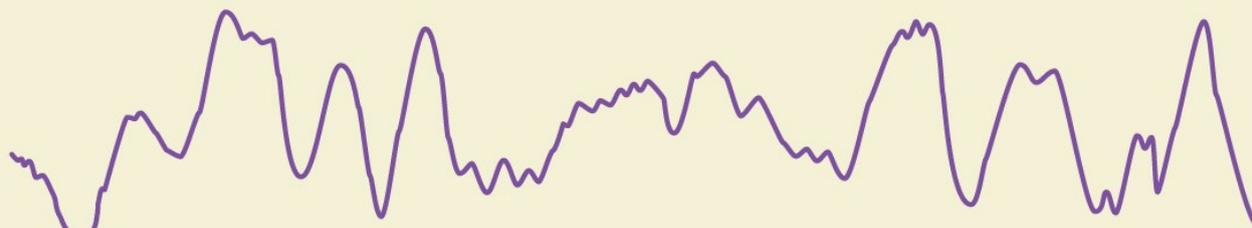

**Relaxed**

**Asleep**

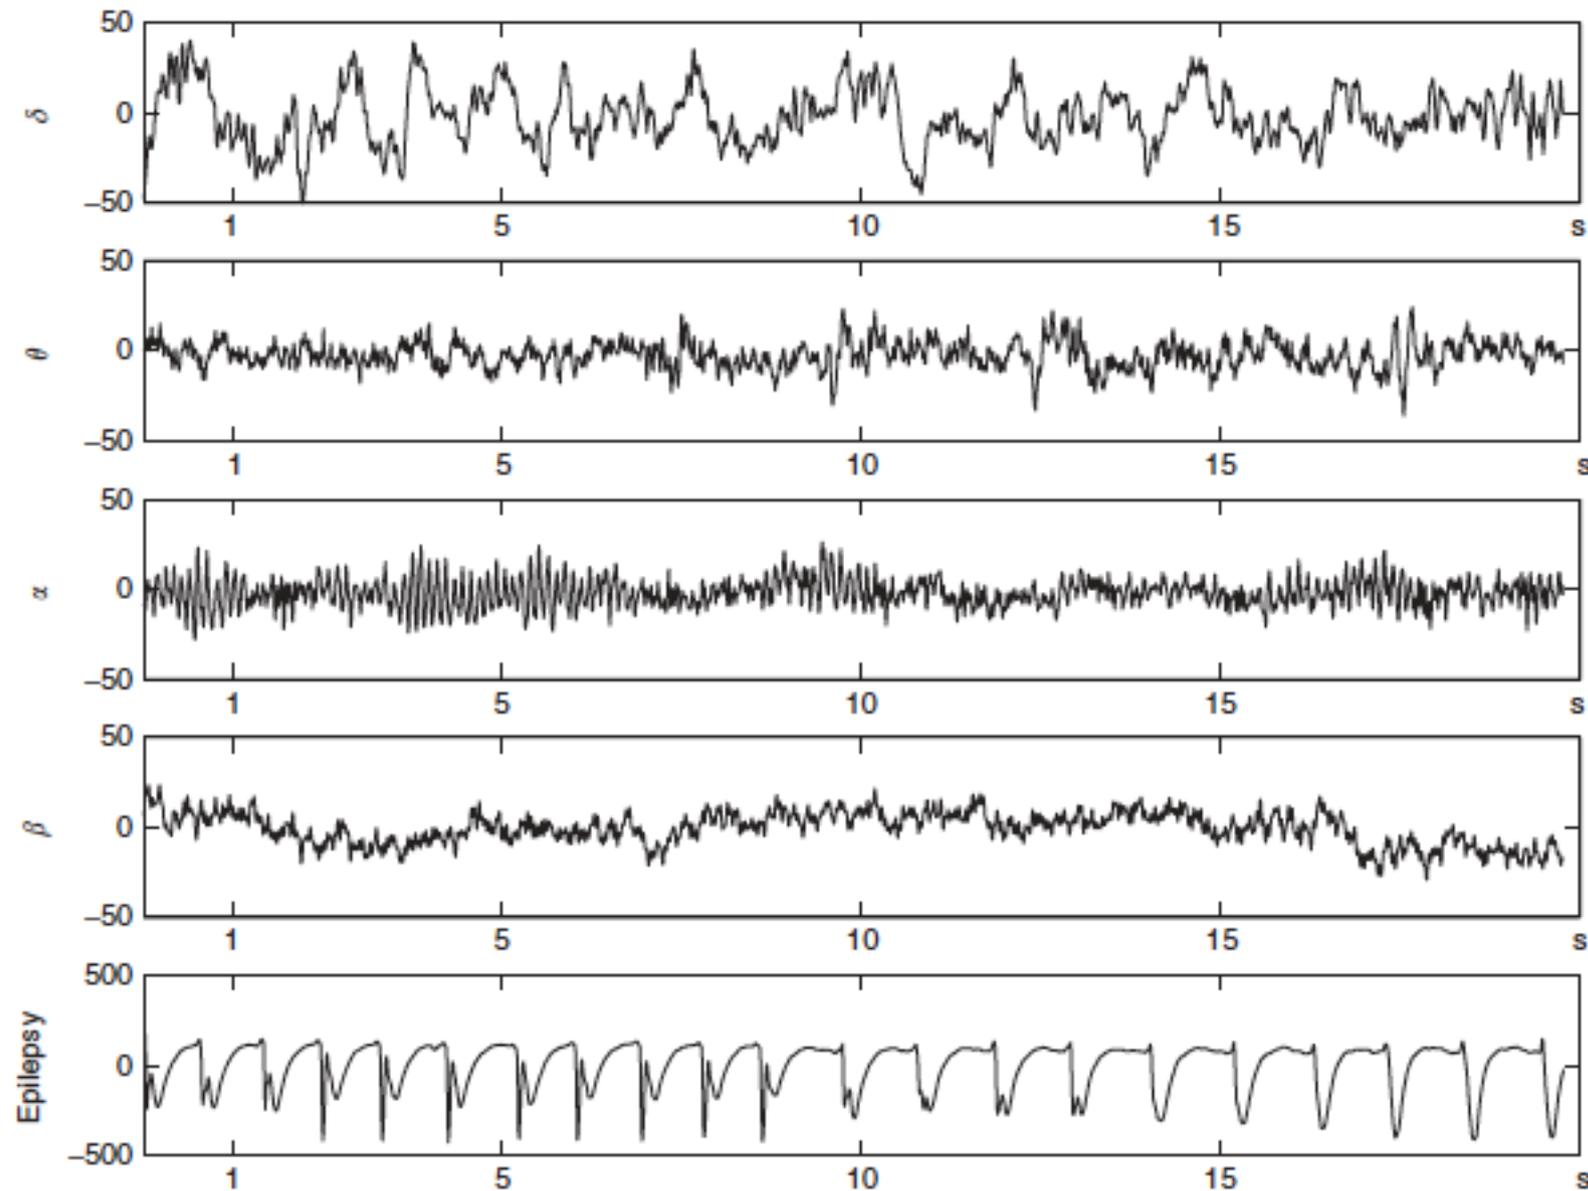

**Deep sleep**

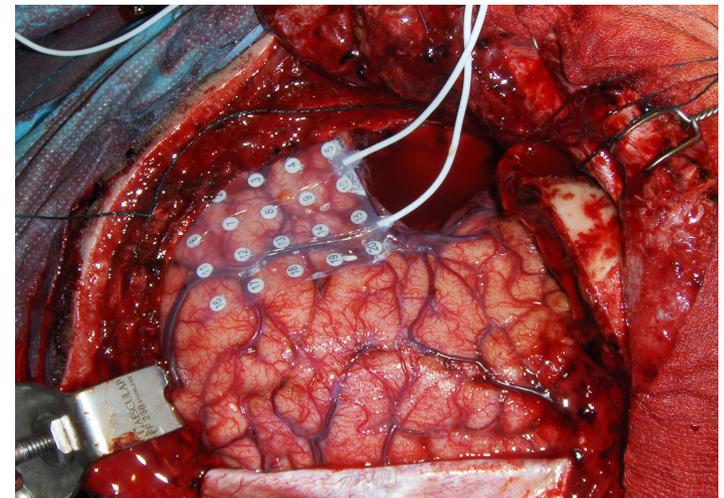

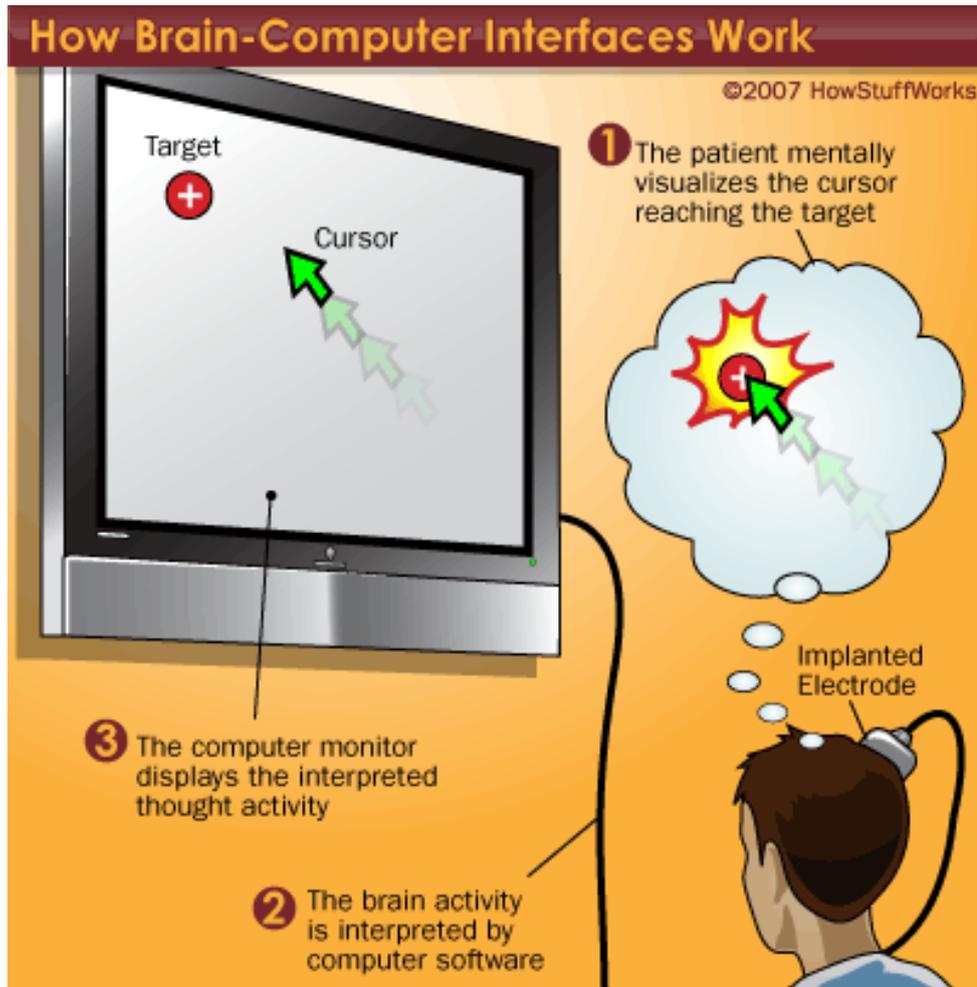

1 second

Characteristic EEG rhythms, from the top: delta (0.5–4 Hz), theta (4–8 Hz), alpha (8–13 Hz), beta (13–30 Hz).

(Blinowska & Durka, 2006)

# Event Related Potentials (ERPs)

# ERPs

Average auditory ERP and visual ERP in logarithmic time scale, showing the commonly recognized components.

Auditory components marked by roman numbers are the brainstem-evoked responses (BAEP). They are followed by mid-latency exogenous components (MAEP).

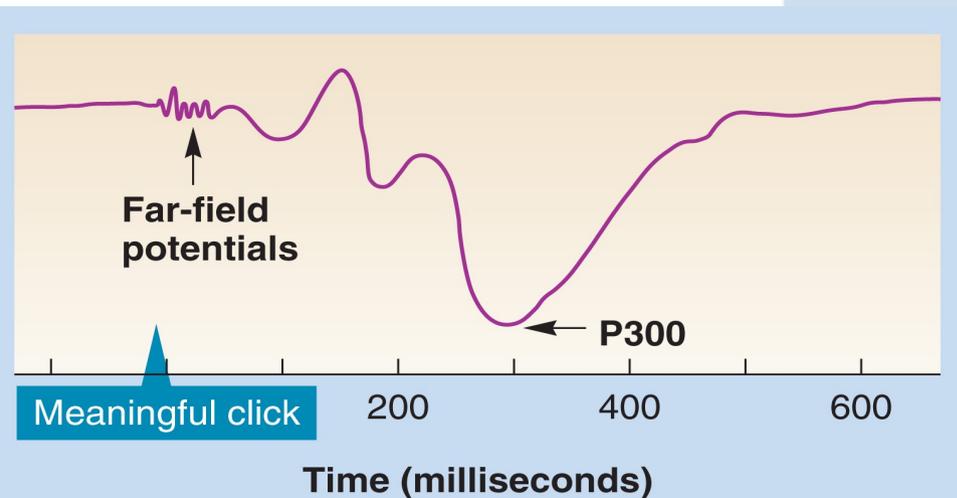

The first peak in exogenous visual ERP comes from ERG (electroretinogram).

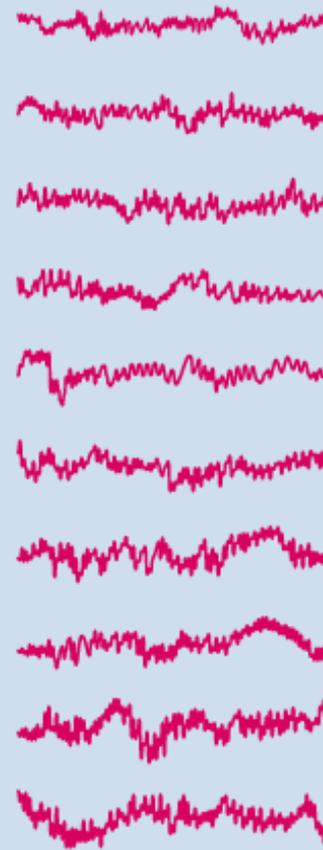

Exogenous ERPs exhibit modality-specific features

Endogenous ERPs are similar in both modalities.

# Event-related potentials (ERP)

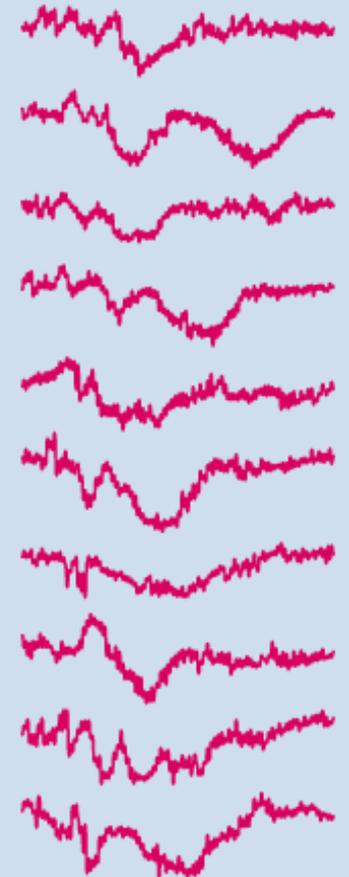

1-second segments of background EEG

Average background EEG

1-second segments of EEG with evoked potential

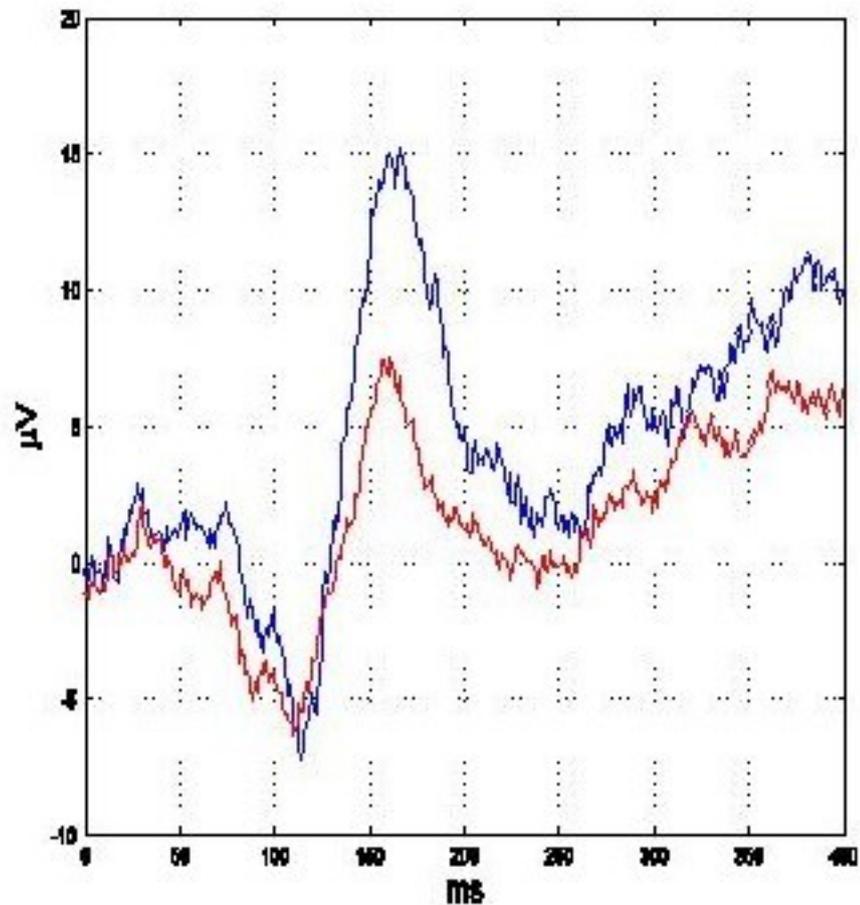

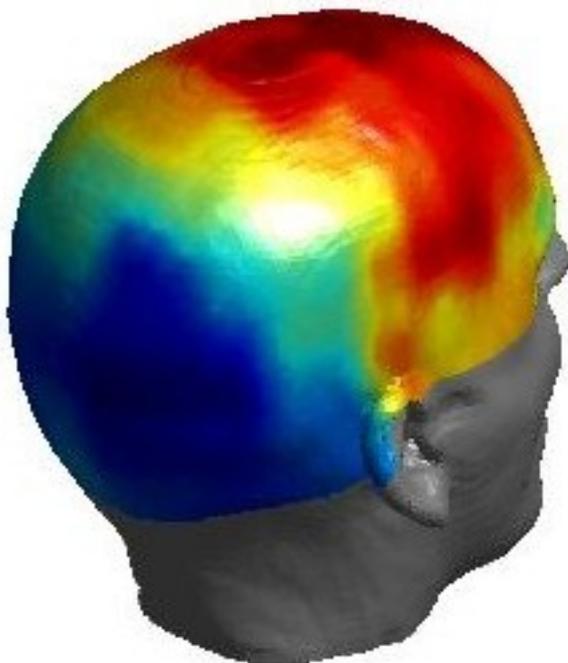

Average evoked potential

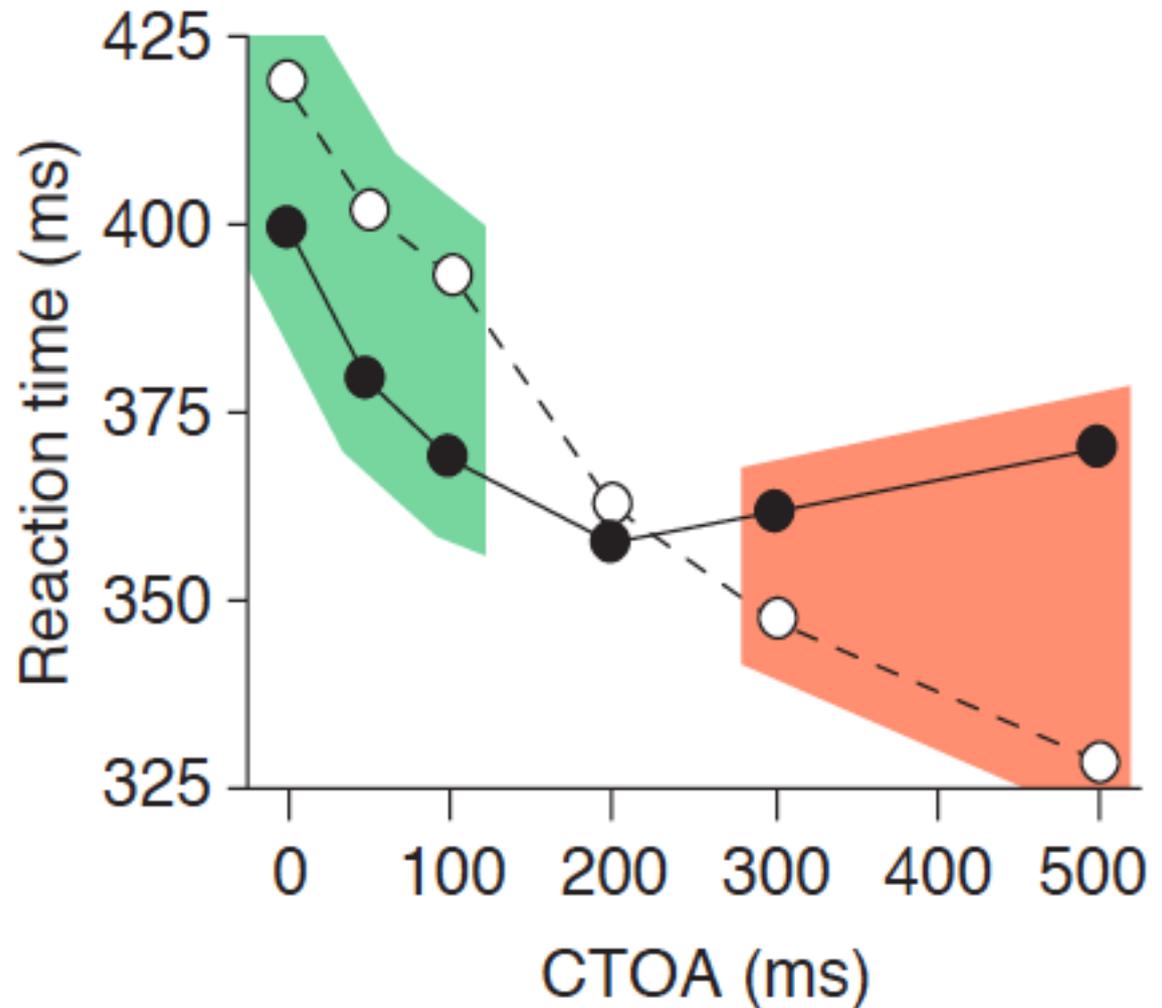

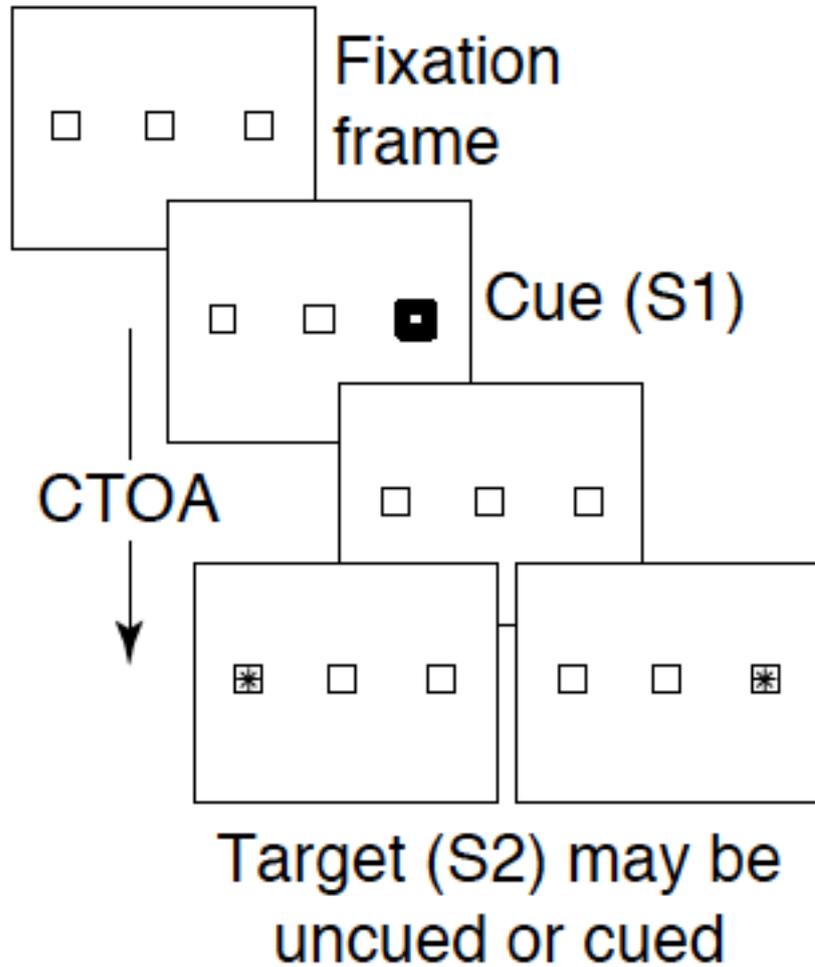

(Pinel, 2011)

# Comparing ERP Components Across Conditions

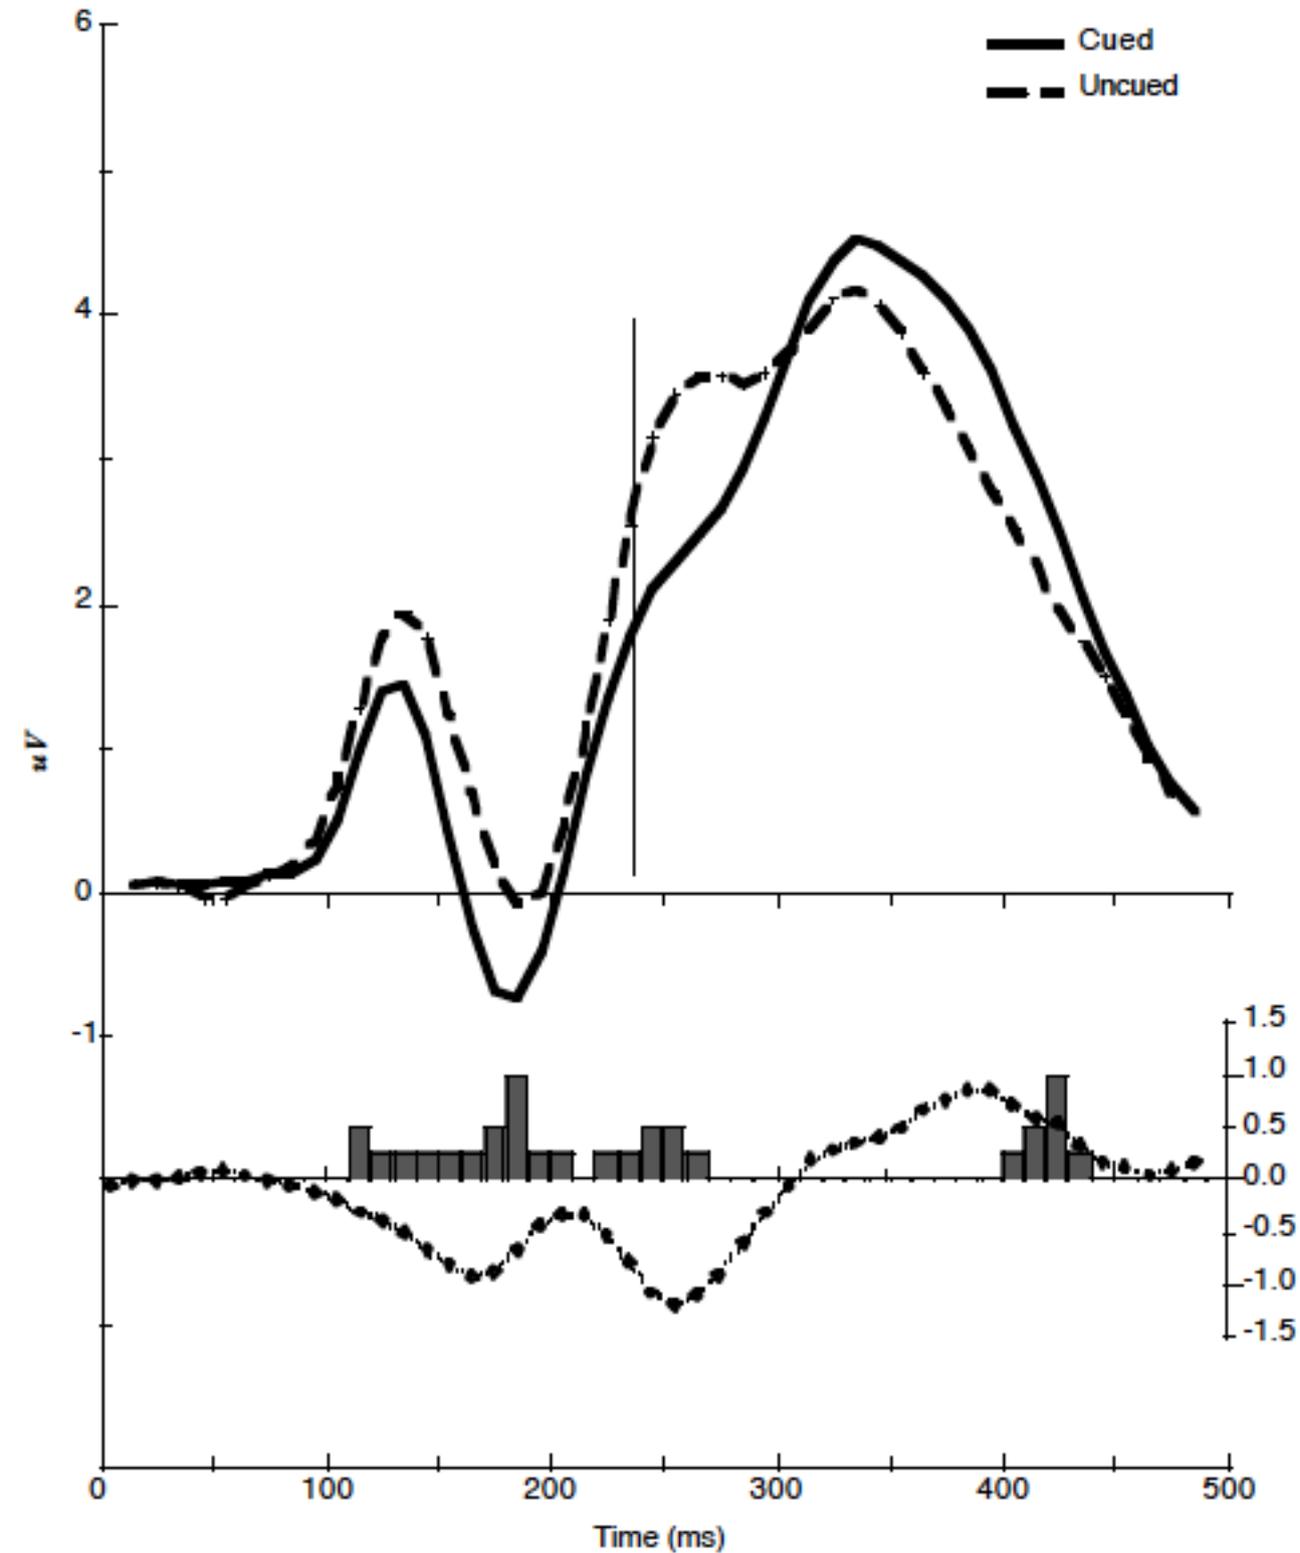

# Example ERP Study

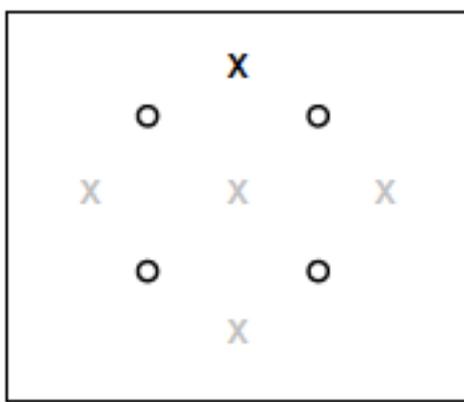

# Inhibition of Return (IOR)

# IOR and ERPs

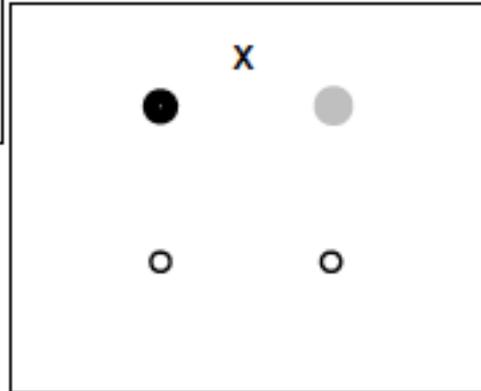

# Spatiotopic vs. Retinotopic IOR

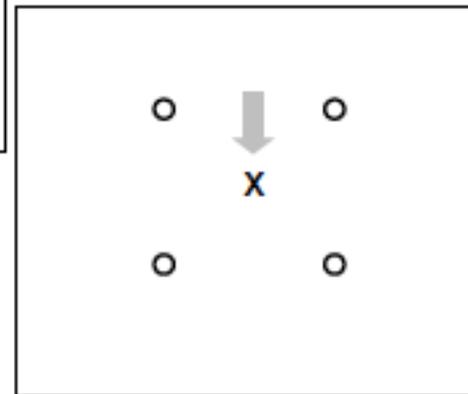

Initial fixation point (x) -  
(5 possible locations)

SOA (EM land-cue onset) -  
400 ms

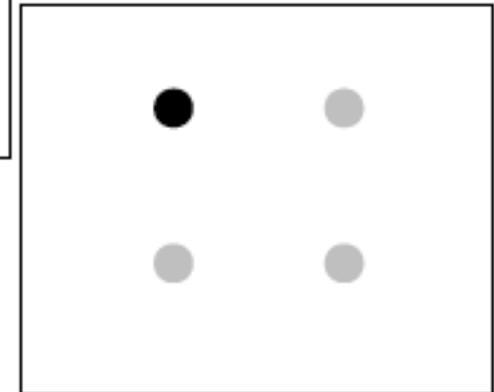

Cue presentation -  
200 ms  
(2 possible locations)

SOA (cue offset-central  
onset) -  
300 ms (*could be varied*)

Saccade to central  
fixation point (*or not*) -  
~250 ms (SRT)

SOA (EM land-target  
onset) -  
500 ms (*could be varied*)

(*Manual or saccadic*) response to  
target appearance -  
(4 possible locations)
