DALHOUSIE UNIVERSITY

DATE: November 1, 2006

AUTHOR: Noah Body

TITLE: THE TITLE

DEPARTMENT OR SCHOOL: Faculty of Computer Science

DEGREE: M.C.Sc.

CONVOCATION: May

YEAR: 2007

Permission is herewith granted to Dalhousie University to circulate and to have copied for non-commercial purposes, at its discretion, the above title upon the request of individuals or institutions.

Signature of Author

The author reserves other publication rights, and neither the thesis nor extensive extracts from it may be printed or otherwise reproduced without the author's written permission.

The author attests that permission has been obtained for the use of any copyrighted material appearing in the thesis (other than brief excerpts requiring only proper acknowledgement in scholarly writing) and that all such use is clearly acknowledged.

Abstract

This is a test document.

Acknowledgements

Thanks to all the little people who make me look tall.

Chapter 1

Introduction

Get it done! Use reference material by Lamport [2] or Gooses, Mittelback, and Samarin [1].

Chapter 2

Doing It

2.1 Getting Ready

Get all the parts that I need. I can throw in a whole pile of terms like preparation, methodology, forethought, and analysis as examples for me to use in the future.

2.2 Next Step

Do it!

Of course, you have to have pictures to show how you did it to make people understand things better.

Thanks to Todd Eavis for providing the sample algorithm.

Algorithm 1 Add Non Essential Views

Input: A tree E consisting of the selected group-bys, and a guiding graph G . Also used are auxiliary variables BP (best plan) and CP (current plan).

Output: Reduced tree R .

{Add nodes from $G - R$ to E as long as the total cost improves}

```

1: repeat
2:   clear  $BP$ 
3:   for every  $v$  in  $G - R$  do
4:     clear  $CP$ 
5:      $CP.node = v$ 
6:     FindBestParent( $R, CP$ )
7:     FindBestChildren( $R, CP$ )
8:     if  $CP.benefit > BP.benefit$  then
9:        $BP = CP$ 
10:    end if
11:  end for
12:  if  $BP.benefit > 0$  then
13:    add  $BP.node$  to  $R$  and update  $R$  accordingly
14:  end if
15: until  $BP.benefit \leq 0$ 

```

Chapter 3

Conclusion

Did it!
